[Appendix](#)

- [Core vulnerability indicators used to inform the DSB stance](#)
- [Near-Term Risk Materialization indicators used to inform the DSB stance](#)
- [Trends in Selected Vulnerability Indicators](#)
- [Trends in Selected Near-Term Risk Materialization Indicators](#)

Overview

- Today, OSFI announced that the Domestic Stability Buffer (DSB) will increase by 0.5% to 3.5% of total risk-weighted assets, effective November 1, 2023.
- The DSB is an important policy tool that contributes to the stability of Canada's financial system. It helps ensure that Canada's domestic systemically important banks (D-SIBs) build up a capital buffer as vulnerabilities grow so that it can be used during periods of stress.
- The decision to increase the DSB reflects OSFI's assessment of elevated and rising systemic vulnerabilities, coupled with stable near-term risks.

- The DSB may increase if vulnerabilities persist or grow further. OSFI also stands ready to reduce the DSB swiftly if necessary to support the resilience of the financial system.

Background

DSB decisions are based on OSFI's assessment of a wide range of quantitative and qualitative information related to vulnerabilities and risks, as well as results from recent stress tests and supervisory judgment. OSFI uses several indicators to inform its vulnerability and risk assessments. These are based on a combination of publicly available and supervisory data. This set of indicators is not exhaustive and may evolve as the economic and risk environment changes. There is also no mechanical link between any indicator and the changes to the DSB. See the Appendix for additional background on the DSB design framework and indicators used to inform decisions.

Supporting rationale

On balance, OSFI assesses that vulnerabilities remain elevated and rising. The current high interest rate environment has made highly indebted households and corporates more vulnerable to shocks. This is reflected in a steady increase in Canadian household debt service ratios in recent quarters, driven by higher interest rates, as principal payments have declined. Based on supervisory filing data, approximately 12% of uninsured mortgage borrowers are only covering interest payments or are negatively amortizing given impacts to variable rate fixed payment loans. This is also reflected in sharply rising debt service ratios on new mortgage originations.

Vulnerabilities to highly-indebted corporates in higher-risk sectors remain a concern, particularly where liquid asset buffers have not grown as quickly.

Housing and commercial real estate market concerns have persisted as valuations remain high coupled with a pick-up in housing market activity. House prices have begun to rise again in recent months as the supply of new listings and inventory remain near historical lows. External vulnerabilities also continue to pose a threat because of elevated global debt levels and increased uncertainty around fiscal and monetary policy. Global central banks are committed to bringing inflation down; however, considerable uncertainty on the future path remains.

Near-term risks to D-SIB capital levels are currently assessed to be low and stable. D-SIB common equity tier 1 leverage and liquidity ratios are comfortably above minimum requirements based on recent reporting data. Operating performance remains solid despite some uptick in performing provisions. Loan delinquencies remain near historically low levels and net interest margins appear to be stabilizing.

The risk environment is expected to be characterized by heightened uncertainty as the effects of higher interest rates take hold, with risks to growth skewed to the downside. Canadian macroeconomic conditions remain supportive of an increase in the DSB, with the unemployment rate near its record low and GDP growth remaining positive. At the same time, financial market conditions have calmed after recent bouts of volatility associated with banking concerns in the US and Switzerland.

Appendix

The DSB is intended to address vulnerabilities that are cyclical, measurable, and have a system-wide impact. The main indicators used to inform the decision to adjust the DSB level, relate to Canadian household and corporate indebtedness, asset market imbalances, as well as external and related factors such as inflation, debt servicing costs and global debt levels. These systemic vulnerabilities are assessed and weighed against the potential materialization of losses to D-SIBs in the near term. For near-term risks, OSFI monitors recent and leading indicators of D-SIB financial performance, as well as economic and financial market conditions. These include D-SIB capital ratios, expected credit losses, impaired loans, the unemployment rate, and market volatility.

Core vulnerability indicators used to inform the DSB stance

Canadian Household Indebtedness

- Household debt levels and serviceability

Canadian Asset Imbalances

- Housing and CRE price levels and valuations

Canadian Institutional Indebtedness

- Corporate debt levels and serviceability
- Sovereign debt levels

External Systemic Vulnerabilities

- Global debt levels
- Economic policy uncertainty

Near-Term Risk Materialization indicators used to inform the DSB stance

D-SIB financial performance - recent trends

- Capital ratios
- Credit losses and impairments

D-SIB financial performance - leading indicators

- Near-term outlook
- Market-based risk indicators

Labour Market and Economic Indicators

- Unemployment rate
- Consumer / Business Insolvencies

Financial market and liquidity conditions

- Market, funding and counterparty stress
